library(ggplot2)
allowWGCNAThreads()
## Allowing multi-threading with up to 8 threads.
setwd('E:/WGCNA')
```

1. Read data

```
data<- read.csv('Counts.csv', row.names = 1)
Sample_info<- read.csv('Sample_info.csv', row.names = 1)</pre>
```

2. Quality control

```
gg<- goodSamplesGenes(t(data))
```

Step1: Detect outlier genes with WGCNA package

```
## Flagging genes and samples with too many missing values...
## ..step 1
## ..step 2
```

summary(gg)

```
## Length Class Mode
## goodGenes 28089 -none- logical
## goodSamples 52 -none- logical
## allOK 1 -none- logical
```

gg\$allOK

[1] FALSE

#Since it indicates tat all genes are not good genes let's quantify the outlier genes #We'll do it for samples as well

table(gg\$goodGenes)

```
## ## FALSE TRUE ## 3576 24513
```

table(gg\$goodSamples)

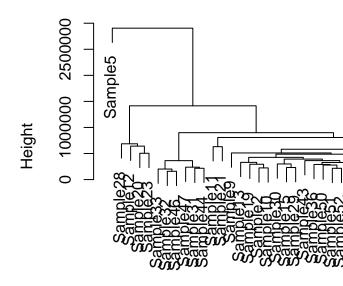

```
## TRUE ## 52
```

#Around 3500 outlier genes but no outlier samples. Let's remove those genes

```
data<- data[gg$goodGenes=='TRUE',]
```

```
htree <- hclust(dist(t(data)), method = "average")
plot(htree)</pre>
```

Cluster Do

Step2: Identify outlier samples with hierarchical clustering #### Step3: Identify outlier samples with PCA

```
pca <- prcomp(t(data))
pca.dat <- pca$x

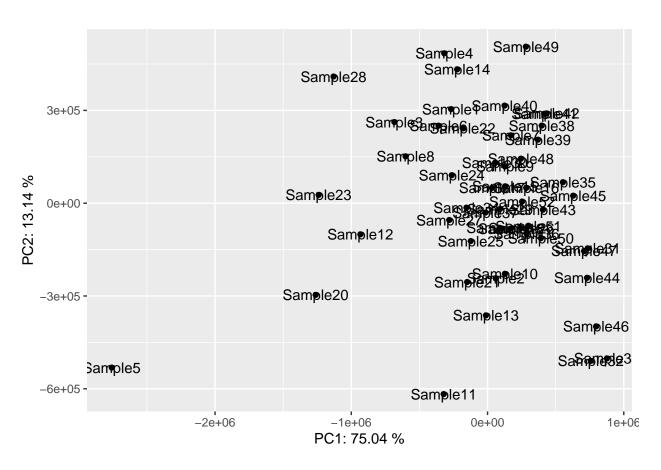

pca.var <- pca$sdev^2
pca.var.percent <- round(pca.var/sum(pca.var)*100, digits = 2)

pca.dat <- as.data.frame(pca.dat)

ggplot(pca.dat, aes(PC1, PC2)) +
   geom_point() +
   geom_text(label = rownames(pca.dat)) +
   labs(x = paste0('PC1: ', pca.var.percent[1], ' %'),

   y = paste0('PC2: ', pca.var.percent[2], ' %'))</pre>
```

dist(to

```
#N.B. We need to remove batch effect if there's any at this stage before we proceed further #In both these methods we found Sample5 is distantly related #So we'll exclude them discard_samples<- c('Sample5') data.final<- data[,!colnames(data) %in% discard_samples] Sample_info_final<- Sample_info[!row.names(Sample_info) %in% discard_samples,]
```

4. Perform VST normalization with DESeq2 since it's a count matrix

#N.B. FPKM or RPKM matrices need to be log transformed #Before performing normalization make sure if the rownames in matrix and colnames in #Sample info are identical

```
all(rownames(Sample_info_final)%in%colnames(data.final)) #If present
## [1] TRUE
all(rownames(Sample_info_final)==colnames(data.final)) #If present in same order
```

[1] TRUE

Create deseq2 object

[1] 24513

Remove samples that have <15 counts in more than 75% of the samples #Recommended by WGCNA #However, the downstream analysis with higher # of genes will depend largely on #the available ram of PC. So, we'll consider gene numbers based on our PC capacity.

```
keep <- dds[rowSums(counts(dds) >= 15)>=39,] #75% of 52 samples is 52*0.75=39
nrow(keep)
```

[1] 12226

```
dds.vst<- vst(keep)
dds.vst<- dds.vst[1:5000,] #We reduced the # of genes to 8000 because of low RAM
nrow(dds.vst)</pre>
```

Perform VST transformation

[1] 5000

Get normalized counts

```
norm.counts <- assay(dds.vst) %>%
t()
```

5. Constructing network

Set softhreshold power

```
power <- c(c(1:10), seq(from = 12, to = 50, by = 2))
```

Set the network topology analysis function

```
## pickSoftThreshold: will use block size 5000.
    pickSoftThreshold: calculating connectivity for given powers...
##
      ..working on genes 1 through 5000 of 5000
##
      Power SFT.R.sq slope truncated.R.sq mean.k. median.k.

12. Identifying significant genes against different features of data

Calculating the module membership and the associated p-values

The module membership/intramodular connectivity is calculated as the correlation of the eigengene and the gene expression profile.

This quantifies the similarity of all genes on the array to every module.

```
module.membership.measure <- cor(module_eigengenes, norm.counts, use = 'p')
module.membership.measure.pvals <- corPvalueStudent(module.membership.measure, nSamples)
module.membership.measure.pvals[1:5,1:10]</pre>
```

```
